

Distribution of X_{new}

- draw $\gamma \theta$ from $\pi(\theta | x)$
- $x_x = \text{seq}(3, 7, \text{length} = 100)$
- $\gamma = d \text{norm}(x_x, \text{mean} = 5, \text{sd} = \frac{1}{\sqrt{\gamma \theta}})$

$$P(X_{\text{new}} > 4.5) = E \left(P(X_{\text{new}} > 4.5 | \theta) \right)$$

over θ

"Knowing the distribution of X_{new} means we should be able to simulate observations as per the distribution of X_{new} "

$$X_{\text{new}} | \sigma^2 \sim N(5, \sigma^2)$$

$$\frac{1}{\sigma^2} \sim \text{Gamma}(\gamma_1, \lambda_1)$$

To Simulate X_{new}

1. Simulate $\frac{1}{\sigma^2}$ from $\text{Gamma}(\gamma_1, \lambda_1)$
2. Given $\frac{1}{\sigma^2}$ from (1) simulate X_{new} from $N(5, \sigma^2)$
3. Repeat 1 & 2 large number of times X_{new}

IMPORTANT

Knowing Joint distribution of 2 r.v. (X, Y) means I know distribution of Y & I " " " $X | Y = y$
